Andrew Corera is the founder and CEO of Corera, a company that specialises in teaching people how to use genitive pronouns. He says he's concerned that big Tech is talking up the threat the existential threat of AI for a particular reason. AI doesn't automate jobs but it can make people 20% more productive, he says. Corera has launched a new course generative AI for everyone to help them understand how AI may affect their job and their business. The course was the fastest growing course on Cera this year with 43,000 Learners signed up in the seven days in the first seven days. It's a sign of the rapid technology explosion of the last week, says Andrew. "I think with this fear and uncertainty there's a lot of interest and I think this is not played with myself yet I think I'm this SP AI," says Corera. "This is what I saw with Elon musk and the work that he's been doing with open source technology just last week I think it's just incredible" "I'm very concerned if we end if we're on the path to open source software or at least past current regulations that make it so difficult for people to write free software for anyone to build on which has been amazing contribution to the world," says corer. "There's more of the AI existential risk fear in Europe than in the United States uh but I'm concerned about regulations on both sides," he adds. "It's not to think of AI timating jobs but Altimating tasks so what my teams do is we actually take jobs break them down into tasks for example," says Corera. "I think there's been a lot. of interest from our audience about you coming on to talk to us about AI and how you see the intersection of deep learning machine learning neural networks impacting jobs" "We want to help you understand how this may affect your job and how this might affect your business or your business," he says, "and we want you to help us understand how you can use AI in your own day-to-day personal life or your work" "What do you think the future of AI holds for us?" asks corera, "What are your predictions for the future?" "I don't see any plausible path by which AI will make human go extinct um but the notion that they could just creates a lot of fear and unfortunately this creates cover for lobbyist as well as some Regulators that pass laws" "How do you see AI changing the world in the next few years?" "What is the impact of AI on the world?" "How will

AI change the world for the better or the worse in the 21st century?" "Is AI going to have a big impact on the way we live and work in the future and how will it change the way people interact with each other in a more positive way or in a way that we interact with the world and in a better way in the 2030s and 20th century?"
